Due to a change in legislation in North America, sockets with integrated RCD have been installed in the USA and Canada since 2017. These RCDs have a nominal value of 5mA with a tolerance between 4mA and 6mA. On these sockets, our gas units can cause RCDs to trigger.

Changes

› Going forward, gas units in the CSA version are going to be built with a connection cable without plug (SI and MI units).

General information

› If the RCD triggers, the plug on the connection cable has to be removed and a fixed connection (hard-wire) made.
› Further information can be found in the original installation instructions.
