

TI_2137: Shipping label with MAC address

iCombi Pro / iCombi Classic

30/12/2021

Subject

To make it easier to integrate iCombi Pro / iCombi Classic in a network and to log in to ConnectedCooking, the MAC addresses of network-compatible units have been positioned on the relevant shipping label.

Affected product/accessories

iCombi Pro / iCombi Classic:

- ConnectedCooking

Notice:

An Ethernet or WLAN connection is required to use ConnectedCooking. Units from the iCombi Pro series have these connections as standard. The connections are available as an option for units from the iCombi Classic series

General information

The iCombi Pro / iCombi Classic has a LAN and a WiFi-MAC address. This is used by IT administrators and service technicians to register the RATIONAL units securely in a network

The MAC addresses are important identification numbers for network-compatible units **These numbers are now positioned on the shipping label (1).**

This means that the information is available in advance and not only when the unit installation is complete. This reduces the time required for installation and also enables integration in the network parallel to the unit installation.
