Topic

480V new standard voltage for iVario in North America.

Affected product/accessories

All iVario (440V/480V units)

General information

To reduce the complexity of the ordering process and to meet customer requirements, a change has been made to an iVario configuration in the USA and Canada. The change relates to combined voltage options for the iVario. This message only relates to a change to 440V/480V iVario units.

The North American market shows that the vast majority of customers who use 440V or 480V electricity use 480V in their kitchen. Accordingly, the iVario standard has been changed and all 440V/480V units were replaced with 480V pre-configured at the factory from August 2, 2022. This reduces the risk of incorrect configuration of the units.

If a 440 V power supply is used at the installation site, the iVario can be switched to this voltage quickly by the service technician during installation. Further information is available in the installation manual.

Availability: All units with a production date of 08/2022 or later. The adjustment is free of charge for certified installation.

NOTE:

No further action is required.
